(57) [Abstract]

[Problem] When periphery is dark regarding conventional liquid crystal display equipment, illumination equipment of for sakeof must be provided, because, there was a limit in thinning, wheninstalling in portable device etc, entire constitution caused problem which thescale-up is done.

[Means of Solution] With this invention, as for illumination equipment 6, consists of protective sheet-cum-lightguide sheet 4 which provides reflecting part 4b in the surface 4a of viewing side of protective plate of transparent touch panel 3, light source 5 which confronts each other in sheet depth surface 4c of this protective sheet-cum-lightguide sheet 4. It is something where liquid crystal display element 2 by fact that it makes liquid crystal display equipment 1 which is made reflective type, combines protective plate which from until recently is adopted as light-guiding sheet and by fact that it combines theillumination equipment, makes that illumination equipment is provided in back surface of liquid crystal display elementumnecessary, solves problem because of this with marked thinning aspossible.

[Claim(s)]

[Claim 1] As it can provide transparent touch panel in seeing a pparent direction forward direction of liquid crystal display element, in this liquid crystal display element illumination equipment which can do strobe according to brightnessof

ネルの保護板の観視側の面に線状若しくは点状の微細な凹部若しくは凸部を反射部として設けた保護板兼用導光板と、この保護板兼用導光板の板厚面に対峙させられた光源とから成り、前記液晶表示素子は反射型とされていることを特徴とする液晶表示装置。

【請求項2】 前記微細な凹凸は、線状の凹部とされたときの幅と深さ、線状の凸部とされたときの幅と高さ、点状の凹部とされたときの径と深さ、点状の凹部とされたときの径と高さの何れもが 0.3m以下とされていることを特徴とする請求項1記載の液晶表示装置。

【発明の詳細な説明】

[0001]

【発明の属する技術分野】本発明は、携帯用情報端末機器などの表示部として用いられている液晶表示装置に関するものであり、詳細には、電池の消費量を低減するために、周囲が明るい場合には外光により表示を読取り、周囲が暗い場合には内蔵の照明装置により表示を読取る構成とした液晶表示装置に係るものである。

[0002]

【従来の技術】従来のこの種の液晶表示装置90の構成の例を示すものが図4であり、この液晶表示装置90においては、液晶表示素子91の背面側には透反(透過反射)板92が設けられると共に、該透反板92の更に背面には、板厚面93aに冷陰極蛍光灯などの光源94を対峙させた導光板93が設けられている。

【0003】前記導光板93の背面93bには線状若しくは点状の微細な凹部若しくは凸部が設けられ、前記光源94からこの導光板93内に入射された光を表面93cに向けて反射するものとされている。そして、前記光源94は周囲の明るさに応じて点滅が行えるものとされている。

periphery when observing being provided, in liquid crystal display equipment whichbecomes, as for aforementioned illumination equipment on aspect of viewing side of the protective plate of aforementioned transparent touch panel microscopic recessed part of line or dot or the protective sheet-cum-lightguide sheet which provides raised part as reflecting part, light source which confronts each other in sheet depth surface of this protective sheet-cum-lightguide sheet, It consists of , Aforementioned liquid crystal display element designates that it is made reflective type as feature, liquid crystal display equipment.

[Claim 2] As for aforementioned minute relief, when making r ecessed part of linear, the width and depth, When making raised part of linear, width and height, When making recessed part of point, diameter and depth, When making recessed part of point, diameter and height, liquid crystal display equipment which designates that in each case is made 0.3 mm or less asfeature, states in Claim 1.

[Description of the Invention]

[0001]

[Technological Field of Invention] This invention is something regarding liquid crystal display equipment which is used as portable data terminal or other displayin detail, when in order to decrease consumed amount of battery, peripheryis bright, when indication reading and periphery are dark with theoutside light, is something which relates to liquid crystal display equipment which is made the constitution which grasps indication with internal illumination equipment.

[0002]

[Prior Art] Those which show example of constitution of liquid crystal display equipment 90 of this kindof conventional are Figure 4, it can provide being transparent counter(Transmission reflection) plate 92 in back surface side of liquid crystal display element 91 as regarding this liquid crystal display equipment 90, furthermore in back surface of said transmitting/reflecting sheet 92, light-guiding sheet 93 which confronts each other has been provided cold cathode fluorescent lamp or other light source 94 in sheet depth surface 93a.

[0003] Microscopic recessed part or raised part of line or dot ar e provided in back surface 93b of theaforementioned light-guiding sheet 93, reflect from aforementioned light source 94 the light which incidence is done destined for surface 93c inside this light-guiding sheet 93. And, as for aforementioned light source 94 can do strobe according to the brightness of periphery.

【0004】また、前記液晶表示素子91の観視方向側には入力手段としての透明タッチパネル95が設けられ、加えて、この透明タッチパネル95を操作するときの押圧が前記液晶表示素子91に伝わり、表示が不鮮明になったり、極端な場合には破損を生じるのを防止するために、透明樹脂などで形成された保護板96が液晶表示素子91と透明タッチパネル95との間に設けられている。

【〇〇〇5】上記の構成とした液晶表示装置9〇は、周囲が明るい状況においては、この液晶表示装置9〇内に入射した外光が前記透反板92に反射し、観視者に達し表示の読取りが行えるものとなるので、光源94を消灯した状態においても充分に表示が読取れるものとなる。従って、光源94を点灯させるための電力は低減され電池寿命の延長が可能となる

[0006]

【発明が解決しようとする課題】しかしながら、前記した従来の構成の液晶表示装置90においては、周囲が暗いときに備えるためにの導光板93は設けざるを得ないものであり、これにより、例えば卓上用の機器の表示部として用いられているものと厚さ、重さの面でそれ程に変わらず、小型化、軽量化が優先される携帯用機器のための表示部としては、充分に要求を満たすものとなっていない問題点を生じている。

【0007】また、周囲が明るい状況では、表示は外光の反射光、即ち、液晶表示素子91を二回透過する光で読取られ、液晶表示素子91は反射型として使用され、周囲が暗い状況では、表示は導光板93からの光の透過光、即ち、液晶表示素子91を一回透過する光で読取られ、液晶表示素子91は透過型として使用される。よって、例えば表示のコントラストなどにも周囲が明るい状況下と、周囲が暗い状況下では差異を生じるものとなり、表示品位が低下し使用者に違和感を与える問題点も生じ、これらの点の解決が課題とされるものとなっていた。

[8000]

【課題を解決するための手段】本発明は、前記した従来の課

[0004] In addition, as input means it can provide transparent to uch panel 95 in viewing direction side of theaforementioned liquid crystal display element 91, adds, when operating this transparent touch panel 95, pressure istransmitted to aforementioned liquid crystal display element 91, protective plate 96 which was formed inorder to prevent fact that indication becomes indistinct, inextreme case causes breakage, with transparent resin etc is provided with theliquid crystal display element 91 and transparent touch panel 95.

[0005] Inside this liquid crystal display equipment 90 outside light which incidence is done to reflect theliquid crystal display equipment 90 which is made above-mentioned constitution, in theaforementioned transmitting/reflecting sheet 92 regarding status where periphery is bright, to reach to observer, because it becomes something which can do thereading of indication, it becomes something which can grasp indicationin satisfactory regarding state which light source 94 extinguishing is done. Therefore, electric power in order lighting to do light source 94 is decreased and extension of battery lifetime becomes possible.

[0006]

[Problems to be Solved by the Invention] But, Before was inscribed regarding liquid crystal display equipment 90 of conventional constitutionwhich, When periphery is dark, you must provide light-guiding sheet 93 because it hasbeing something to be, Because of this, satisfies request in satisfactory as display for theportable device where miniaturization and weight reduction take precedence not to change thatmuch, problem which does not become something which is caused in theaspect of thing and thickness, weight which are used as display of theequipment for for example tabletop.

[0007] In addition, with status where periphery is bright, as fori ndication reflected light of outside light, namely, it is grasped with the light which two times transmits liquid crystal display element 91, liquid crystal display element 91 is used as thereflective type, with status where periphery is dark, as for indication the transmitted light of light from light guide plate 93, namely, is grasped with light whichone time transmits liquid crystal display element 91, liquid crystal display element 91 is used as transmission type. Under status where periphery is bright and, under status wherethe periphery is dark it became something which causes difference even in the contrast etc of for example indication, display quality decreased and also the problem which gives sense of misfit to user occurred, had becomesomething where solution of these points makes problem

[0008]

[Means to Solve the Problems] As for this invention, Before ex

題を解決するための具体的な手段として、液晶表示素子の観視方向前方には透明タッチパネルが設けられると共に、この液晶表示素子には観視時の周囲の明るさに応じて点滅が行える照明装置が設けられて成る液晶表示装置において、前記照明装置は前記透明タッチパネルの保護板の観視側の面に線状若しくは点状の微細な凹部若しくは凸部を反射部として設けた保護板兼用導光板と、この保護板兼用導光板の板厚面に対時させられた光源とから成り、前記液晶表示素子は反射型とされていることを特徴とする液晶表示装置を提供することで課題を解決するものである。

[0009]

【発明の実施の形態】つぎに、本発明を図に示す実施形態に基づいて詳細に説明する。図1に符号1で示すものは本発明に係る液晶表示装置であり、この液晶表示装置1は観視時の周囲の明るさに応じて点滅が行える照明装置が設けられるものである点は従来例のものと同様である。

【0010】また、本発明の液晶表示装置1においても、従来例のものと同様に液晶表示素子2の観視方向側にはは透明タッチパネル3が設けられるものとされているので、前記透明タッチパネル3を操作するときの押圧から液晶表示素子2を保護するため保護板が必要となる点も従来例のものと同様である。

【 O O 1 1】ここで、本発明では、上記に述べたように必要とされ設けざるを得ない保護板が樹脂による透明部材で形成されていることに着目し、この保護板を利用して照明装置の導光板を兼ねるものとし、保護板兼用導光板4を形成しようと図るものであり、この目的に沿うべく、前記保護板兼用導光板4の観視側の面4 a には線状の微細な凹部(若しくは凸部)、または、点状の微細な凹部(若しくは凸部)とした反射部4 b が設けられている。

【0012】加えて、前記保護板兼用導光板4の板厚面4cには、冷陰極蛍光灯、LEDランプなどの光源5が対峙され、この保護板兼用導光板4内に光を入射させるものとされ、

emplary means in order to solve conventional problem which was inscribed doing. As it can provide transparent touch panel in seeing apparent direction forward direction of liquid crystal display element, the illumination equipment which can do strobe you see in this liquid crystal display element and according to brightness of periphery of apparent time being provided, in theliquid crystal display equipment which becomes, as for aforementioned illumination equipment on aspect of the viewing side of protective plate of aforementioned transparent touch panel microscopic recessed part of theline or dot or protective sheet-cum-lightguide sheet which provides raised part as reflecting part, light source which confronts each other in sheet depth surface of this protective sheet-cum-lightguide sheet, It consists of, It is something which solves problem by fact that theaforementioned liquid crystal display element designates that it is made reflective type as feature, offers liquid crystal display equipment.

[0009]

[Embodiment of Invention] Next, you explain in detail on basis of embodiment which shows the this invention in figure. Those which in Figure 1 are shown with symbol 1 are liquid crystal display equipment which relates to this invention, point which is something where it canprovide illumination equipment which can do strobe as for this liquid crystal display equipment 1 you see and according to brightness of periphery of apparent time is similar tothose of Prior Art Example.

[0010] In addition, regarding liquid crystal display equipment 1 of this invention, in same way asthose of Prior Art Example in viewing direction side of liquid crystal display element 2, because we can provide the transparent touch panel 3, when operating aforementioned transparent touch panel 3, in order toprotect liquid crystal display element 2 from pressure, also point where protective platebecomes necessary is similar to those of Prior Art Example.

[0011] With here, With this invention, As expressed on description above, it is needed and must provide thatyou will pay attention to being formed with transparent member protective plate due to the resin, combine light-guiding sheet of illumination equipment, making use of this protective platewill form protective sheet-cum-lightguide sheet 4 in order that it is something which is assured, it parallels to this object, in surface 4a of viewing side of the aforementioned protective sheet-cum-lightguide sheet 4 microscopic recessed part of wire shape (Or raised part), or, microscopic recessed part of point (Or raised part) with reflecting part 4b which is done is provided.

[0012] In addition, cold cathode fluorescent lamp and LED la mp or other light source 5 confront each other in sheet depth surface 4c of aforementioned protective sheet-cum-lightguide

よって、光源5から保護板兼用導光板4内に入射された光は、観視側の面4 a に施された微細な凹部若しくは凸部とした反射部4 b で反射して進行方向を換え、保護板兼用導光板4の表示素子側の面4 d に達し射出されるものとなり、即ち、液晶表示素子2を照明する照明装置6となる。

【0013】図2に示すものは前記保護板兼用導光板4の観視側の面4aに施される反射部4bの形状の一例であり、この例では反射部4bは一つが略円錐状の凹部として形成され、この反射部4bの観視側の面4aへの配分状態が調整され、表示素子側の面4dから射出する光、即ち、液晶表示素子2を照明する光が均一な明るさになるようにされている。

【0014】尚、発明者による試作、検討の結果によれば、前記反射部4bは上記の略円錐状の凹部のみでなく、図3に示すように、一つが断面略V字状の線状の凹部、即ち、溝状とした反射部4bでも良く、または、図示は省略するが一つが略円錐状の凹部でも良く、更には、一つが断面略V字状の凹部、即ち、畝状でも良いものであることが確認されている

【0015】ここで、前記保護板兼用導光板4の構成について更に詳細に検討してみると、先ず、導光板としての機能は、前記反射部4bの一つの大きさが大きいほど、反射効率は向上し、液晶表示素子2に対する照明効果は向上する。その反面、前記反射部4bの一つの大きさが大きいほど、観視側の面4aの平滑性が損なわれ液晶表示素子2に表示される表示内容の読取性は低下するものとなる。

【0016】そこで、発明者はこの点についても検討を行った結果、図2で示した略円錐状の凹部の例で述べれば一つの反射部4bの径Mおよび深さD、図3の溝状(線状の凹部)の例で述べれば一つの反射部4bの溝幅Wおよび深さDを何れも0.3mm以下とすれば、上記した照明効果を満足させ、且つ、読取性も損なうことのない保護板兼用導光板4とすることが可能であることが確認された。

sheet 4. Incidence we do light inside this protective sheet-cumlightguide sheet 4, from light source 5 lightwhich incidence is done reflecting with reflecting part 4b which is made themicroscopic recessed part or raised part which are administered to surface 4a of the viewing side, changes advancing direction inside protective sheet-cum-lightguide sheet 4, reaches to surface4d of display element side of protective sheet-cum-lightguide sheet 4 and becomes something which emissionis done, namely, becomes illumination equipment 6 which liquid crystal display element 2 illumination is done.

[0013] Those which are shown in Figure 2 are one example of s hape of thereflecting part 4b which is administered to surface 4a of viewing side of theaforementioned protective sheet-cumlightguide sheet 4, with this example as for reflecting part 4b one it is formed, as recessed part of abbreviation cone light where thedivided state to surface 4a of viewing side of this reflecting part 4b is adjusted, from surface 4d of display element side emission does, Namely, illumination is done light which has tried liquid crystal display element 2 that becomes uniform brightness.

[0014] Furthermore it depends on inventor trial manufacture, I n result of examination we depend, As for aforementioned reflecting part 4b being only recessed part of theabove-mentioned cone, it to be, As shown in Figure 3, one recessed part of linear state of cross section V-shape, namely, is good even with reflecting part 4b which is made groove, or, abbreviates illustration but one is good even with recessed part of the cone, furthermore, one is verified recessed part of cross section V-shape, namely, being good ones even in rib condition.

[0015] When here, furthermore it tries examining in detail con cerning the constitution of aforementioned protective sheet-cum-lightguide sheet 4, as for function first, as the light-guiding sheet, when size of one of aforementioned reflecting part 4b islarge, as for reflection efficiency it improves, illumination effect for liquid crystal display element 2 improves. On other hand, when size of one of aforementioned reflecting part 4b is large, smoothness of surface 4a of viewing side is impaired, readability of display content which is indicated in liquid crystal display element 2 becomes something which decreases.

[0016] Then, as for inventor result of examining concerning this point, If you express with example of recessed part of abbreviation conewhich is shown with Figure 2, diameter M and depth D of thereflecting part 4b of one, If you express with example of groove (recessed part of linear state) of Figure 3, groove width Wand depth D of reflecting part 4b of one, If in each case makes 0.3 mm or less, satisfying illumination effect whichwas inscribed, it was verified that it is possible to make protective sheet-cum-lightguide sheet 4which does not have

【0017】保護板兼用導光板4を上記の構成としたことで、液晶表示素子2は周囲が明るく光源5を消灯しているときには、観視側からの外光により照明されるものとなる点は従来例のものと同様であるが、周囲が暗く光源5を点灯した場合にも光源5と保護板兼用導光板4、即ち、照明装置6により観視側から照明されるものとなる。

【0018】このことは、液晶表示素子2は常に反射型として用いられるものとなるので、本発明では液晶表示素子2として、反射型として使用するに適するように透過度を高く設定した、いわゆる反射型と称されるものを採用している。従って、本発明の液晶表示装置1においては液晶表示素子2の背面側には、専らに外光および照明装置6からに光を反射させる反射板7が設けられるものとされている。

【〇〇19】以上説明の構成としたことで本発明の液晶表示 装置 1 は、周囲が明るいときにも、周囲が暗いときにも反射 型として機能するものとなり、従来例のように反射型、透過 型と動作モードが変化することがない。よって、動作モードの変化によるコントラストの低下など表示品質の変化も生じることがない。また、保護板兼用導光板 4 としたことで、従来の液晶表示素子 2 の背面に設けられていた照明装置は当然に不要となり、液晶表示装置 1 の薄型化が可能となる。

【〇〇2〇】また、液晶表示素子2が、透過度が高い反射型専用のものとされたことで、僅かな外光でも表示が読取れるものとなって、照明装置6の点灯が必要とされる状況を減じると共に、照明装置6の光源5を例えばLEDランプなど低消費電力のものでも充分に読取れるものとして、この液晶表示装置1が採用される携帯用機器の電池寿命を一層に延命する。

【0021】尚、実際に実施に当たっては、必ずしも液晶表示素子2の前面に透明タッチパネル3が設けられている必要はなく、例えば液晶表示素子2を防護するための保護板が設けられていれば、その保護板を利用して実施することが可能である。また、照明時と非照明時との表示品質を統一するために、新たに液晶表示素子2の前面に本発明の照明装置6を

fact that also readability impair.

[0017] By fact that protective sheet-cum-lightguide sheet 4 is made above-mentioned constitution, the liquid crystal display element 2 when periphery to be bright extinguishing having done light source 5, the point which becomes something which illumination is done is similar to those of Prior Art Example with outside light from viewing side, but when periphery to be dark lighting it does light source 5 even, it becomes something which illumination is done from viewing side light source 5 and protective sheet-cum-lightguide sheet 4, namely, depending upon illumination equipment 6.

[0018] As for this, liquid crystal display element 2 always because it becomes something which is used as reflective type, in order with this invention you use to be suited as the liquid crystal display element 2, as reflective type those which set permeability highly, are named the so-called reflective type are adopted. Therefore, in liquid crystal display equipment 1 of this invention, in back surface side of liquid crystal display element 2, we can provide reflector 7 which exclusively reflects light from in the outside light and illumination equipment 6.

[0019] Liquid crystal display equipment 1 of this invention, per iphery is bright when and when periphery isdark, becomes something which functions as reflective type by fact thatit it constitutes of or more explanation, like Prior Art Example there are nottimes when reflective type, transmission type and operating mode change. There are not times when also change of display quality such as decrease of the contrast with change of operating mode occurs. In addition, by fact that it makes protective sheet-cum-lightguide sheet 4, illumination equipment which isprovided in back surface of conventional liquid crystal display element 2 becomes properly unnecessary, thethinning of liquid crystal display equipment 1 becomes possible.

[0020] In addition, liquid crystal display element 2, It had to be done reflective type private ones where transmittance is high, With little outside light, becoming something which can graspindication, as it reduces status where lighting of illumination equipment 6 isneeded, light source 5 of illumination equipment 6 battery lifetime of portable device where this liquid crystal display equipment 1 is adopted as with those of low electricity consumption such as for example LED lamp can be grasped in the satisfactory, is done life extension more.

[0021] Furthermore if actually it is not necessary for transpare nt touch panel 3 to be alwaysprovided in front surface of liquid crystal display element 2 at time of execution, and theprotective plate in order protection to do for example liquid crystal display element 2 has been provided, it ispossible to execute making use of protective plate. In addition, in order to

設けても良いものであり、何れの場合にも相応の作用、効果 を期待できるものとなる。

[0022]

【発明の効果】以上に説明したように本発明により、照明装置は透明タッチパネルの保護板の観視側の面に反射部を設けた保護板兼用導光板と、この保護板兼用導光板の板厚面に対峙させられた光源とから成り、液晶表示素子は反射型とされている液晶表示装置としたことで、第一には、従来から採用されている保護板を導光板として兼用し照明装置を兼ねさせたことで、液晶表示素子の裏面に照明装置を設けることを不要とし、この種、携帯用機器に使用される液晶表示装置の格段の薄型化を可能として、携帯用機器の小型化、軽量化に極めて優れた効果を奏するものである。

【〇〇23】また、第二には、上記構成としたことで照明装置の点灯時にも非点灯時にも、液晶表示素子は反射型として表示の読取りが行われるものとし、従来例のように点灯時と非点灯時とで透過型と反射型とに動作モードが変化し、これに伴いコントラストの低下など表示品位が変化して使用者に違和感を抱かせていたのを解消し、表示品質の向上に極めて優れた効果を奏するものである。

【図面の簡単な説明】

【符号の説明】

standardize display quality at time of the illumination and time of unilluminated, it is something which is good to the front surface of liquid crystal display element 2 providing illumination equipment 6 of this invention anew, in case of which it becomes something which can expect fit action and effect.

[0022]

[Effects of the Invention] As explained above, with this inventi on, as for illumination equipment, protective sheet-cumlightguide sheet whichprovides reflecting part on aspect of viewing side of protective plate of the transparent touch panel, light source which confronts each other in sheet depth surface of this protective sheet-cum-lightguide sheet, consists of, As for liquid crystal display element it had to make liquid crystal display equipment which is made reflective type with, first combines protective plate which from until recently isadopted as light-guiding sheet and by fact that it combines illumination equipment, makesthat illumination equipment is provided in back surface of liquid crystal display element unnecessary, theminiaturization of portable device, it is something which possesses effect whichquite is superior in weight reduction this kind, with marked thinning of theliquid crystal display equipment which is used for portable device as possible.

[0023] In addition, As for secondly, By fact that it makes abov e-mentioned constitution at time of the lighting of illumination equipment also in unlit time, liquid crystal display element does reading of indication is done as reflective type, like the Prior Art Example it is something which possesses effect which cancels the fact that at time of lighting and with unlit time transmission type and the reflective type operating mode changes, display quality such as decrease of contrastchanging attendant upon this, holds sense of misfit to user, quite issuperior in improvement of display quality.

D……反射部の深さ

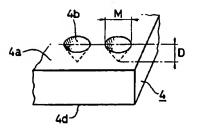

M……反射部の径

W……反射部の溝幅

[図1]

[図2]

- 1..... liquid crystal display equipment
- 2..... liquid crystal display element

3..... transparent touch panel

4..... protective sheet-cum-lightguide sheet

Surface of 4a..... viewing side

4b..... reflecting part

4c..... sheet depth surface

4d...... Surface of display element side

5..... light source

6..... illumination equipment

7..... reflector

D..... depth of reflecting part

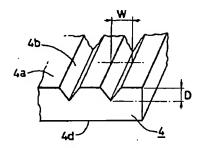

M..... Diameter of reflecting part

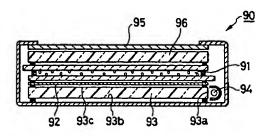

W..... groove width of reflecting part
